

OAuth 2.0

authorization framework

Goal

- ▶ Allow an application to access user resources maintained by a service/server

- ▶ Full reference at <https://oauth.net/2/>

Roles (RFC 6749)

▷ Resource owner

- ♦ An entity capable of **granting access to a protected resource**
- ♦ **End-user**: a resource owner that is a person

▷ Resource server

- ♦ **The server hosting protected resources**
- ♦ Capable of accepting and responding to protected resource requests using **access tokens**

Roles (RFC 6749)

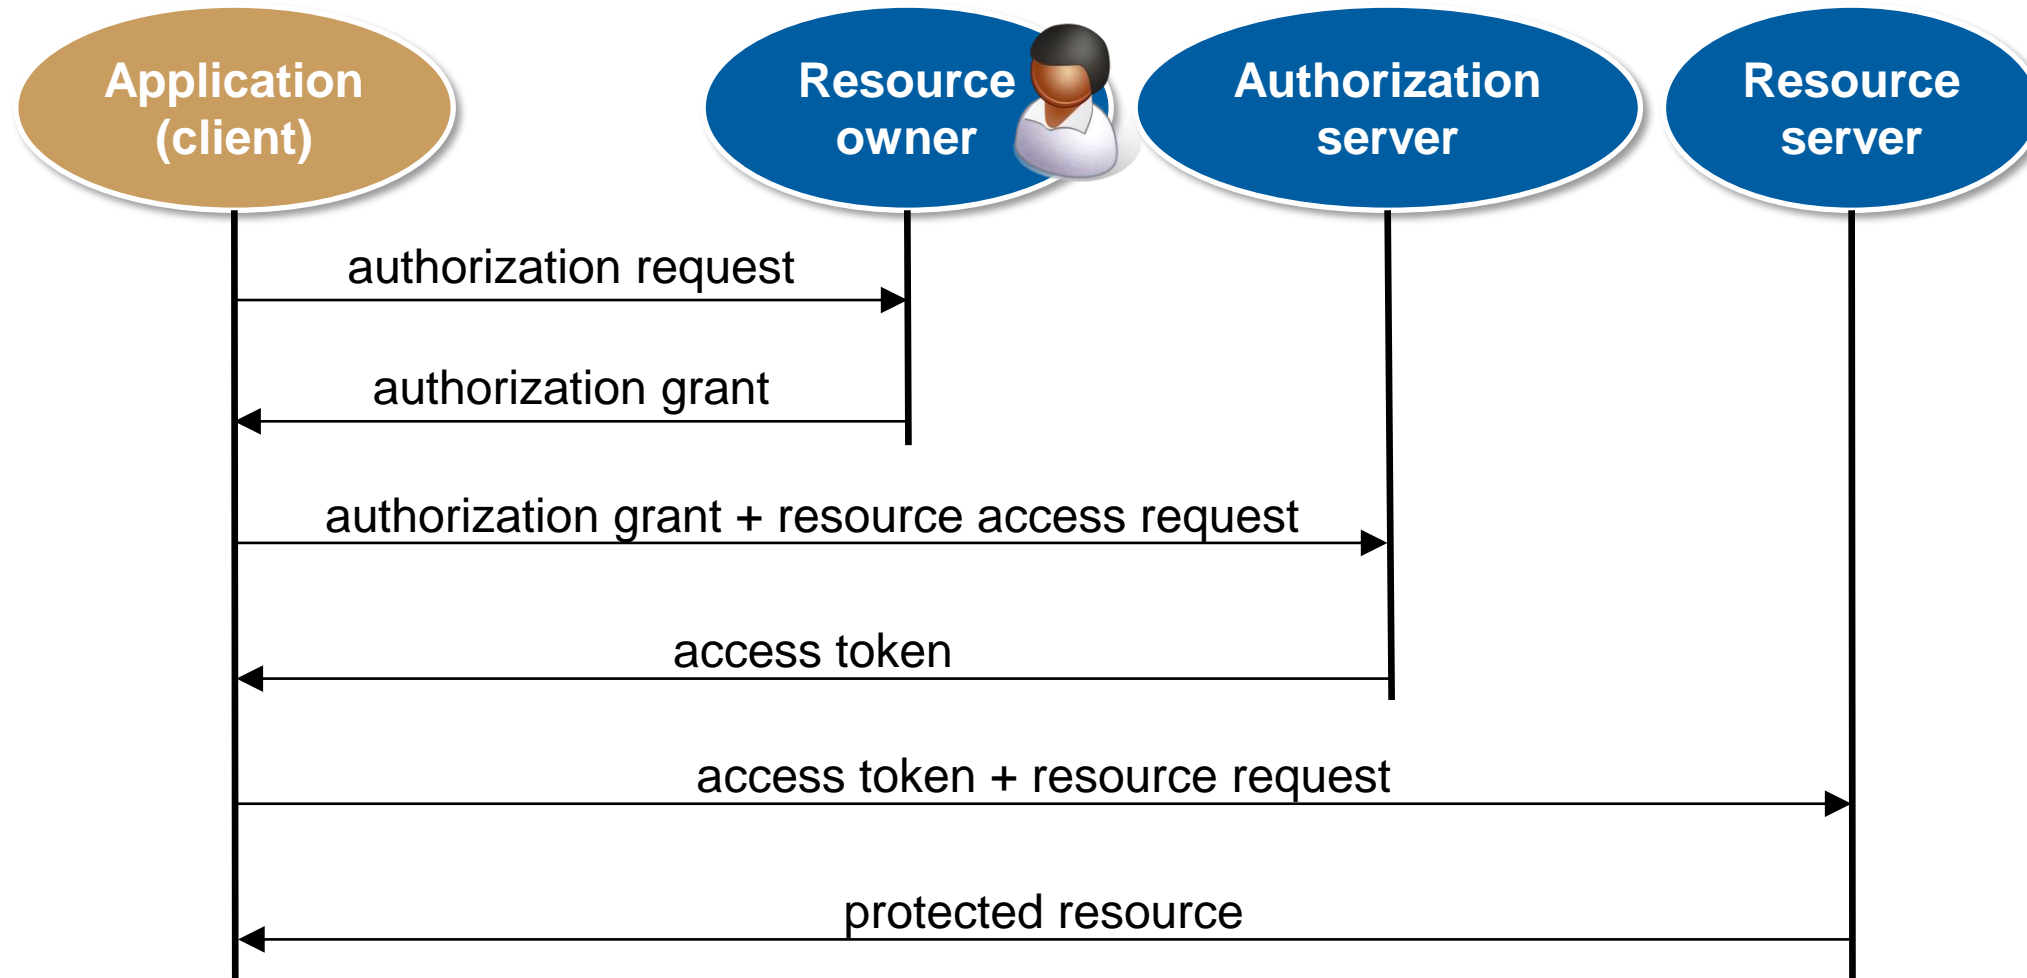

▷ Client

- ♦ An **application** making requests for protected resources on behalf of the resource owner and with its authorization

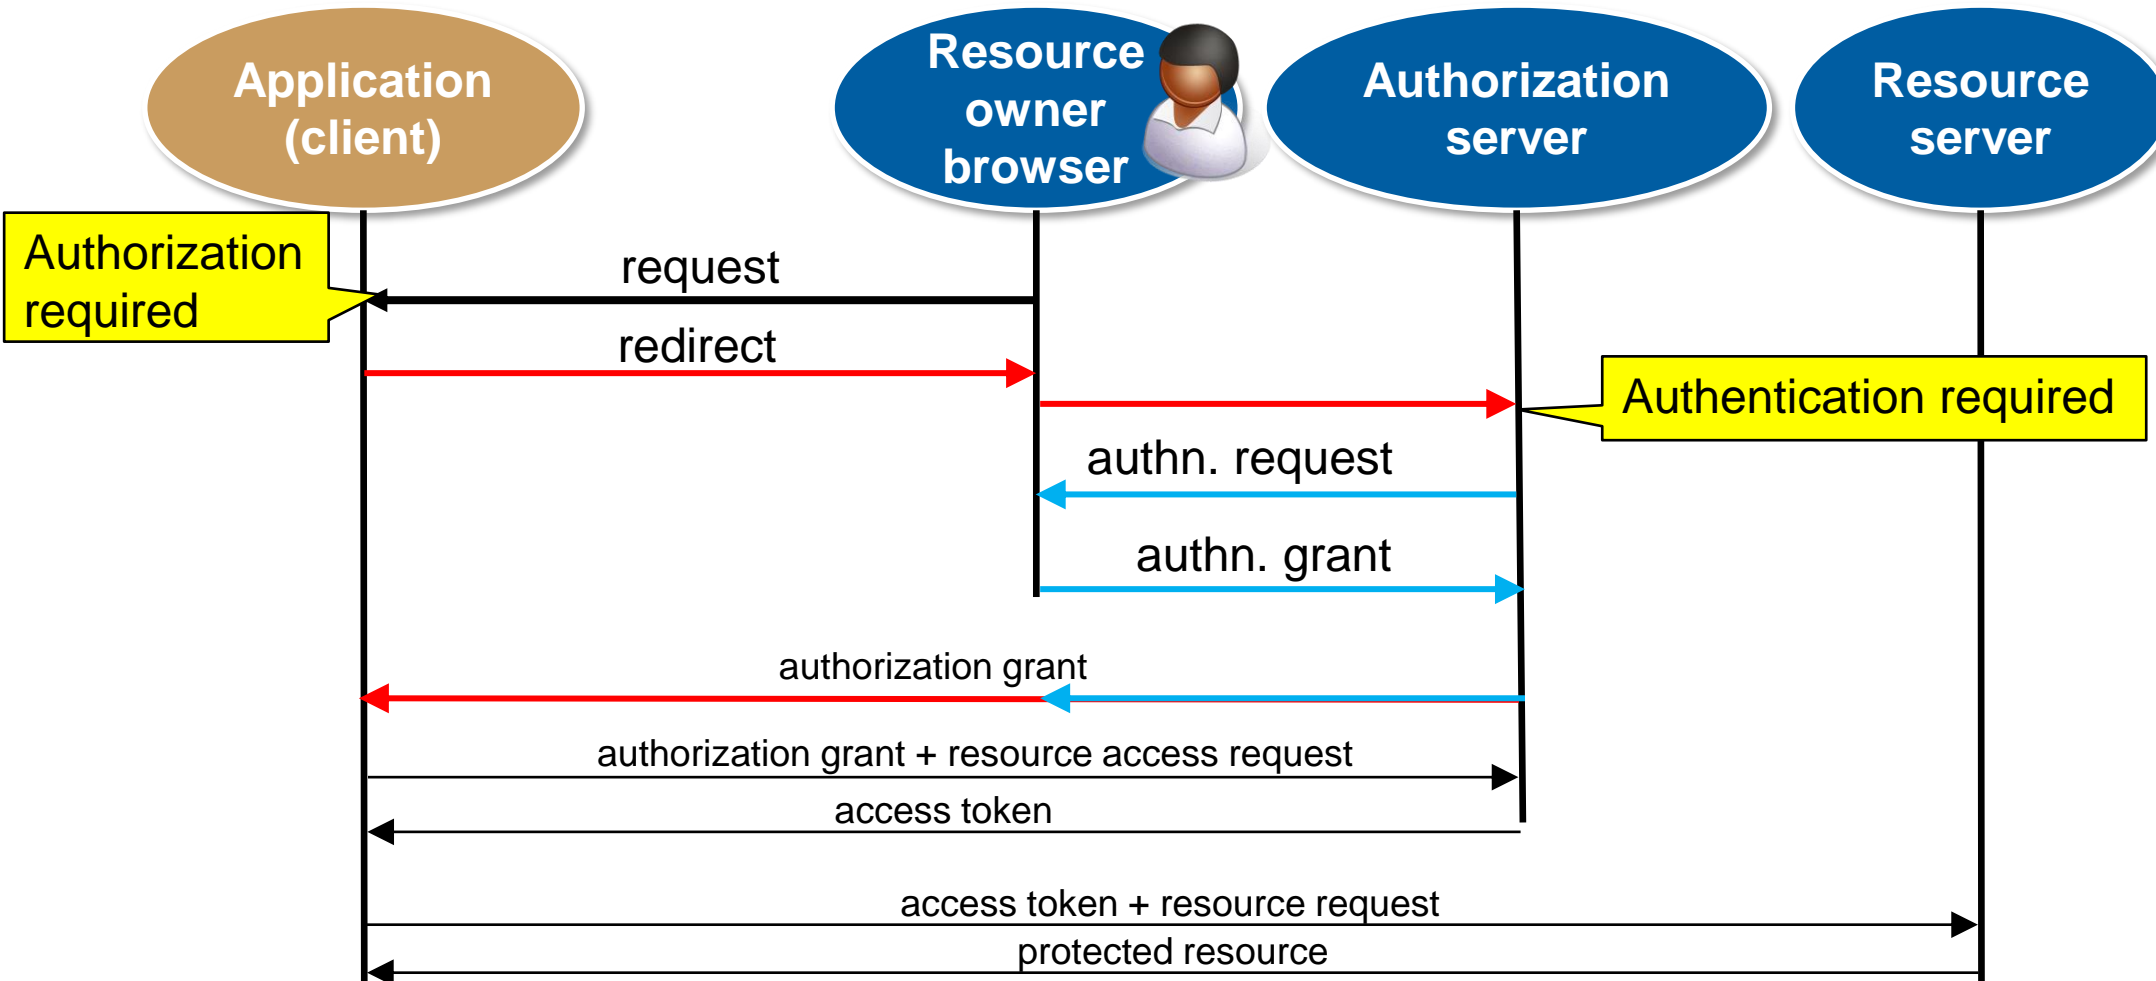

▷ Authorization server (aka OAuth server or provider)

- ♦ The server issuing **access tokens** to the client after successfully **authenticating** the resource owner and obtaining its **authorization** for the client to access one of its resources

Abstract protocol flow (RFC 6749)

Common protocol flow

Communication endpoints: Authorization endpoint

- ▶ Service provided by the **OAuth server**
 - ♦ Authenticates the resource owner (the user)
 - ♦ Asks for the delegation of access rights to its protected resources to the client
 - ♦ Send an authorization grant to the **redirection endpoint**

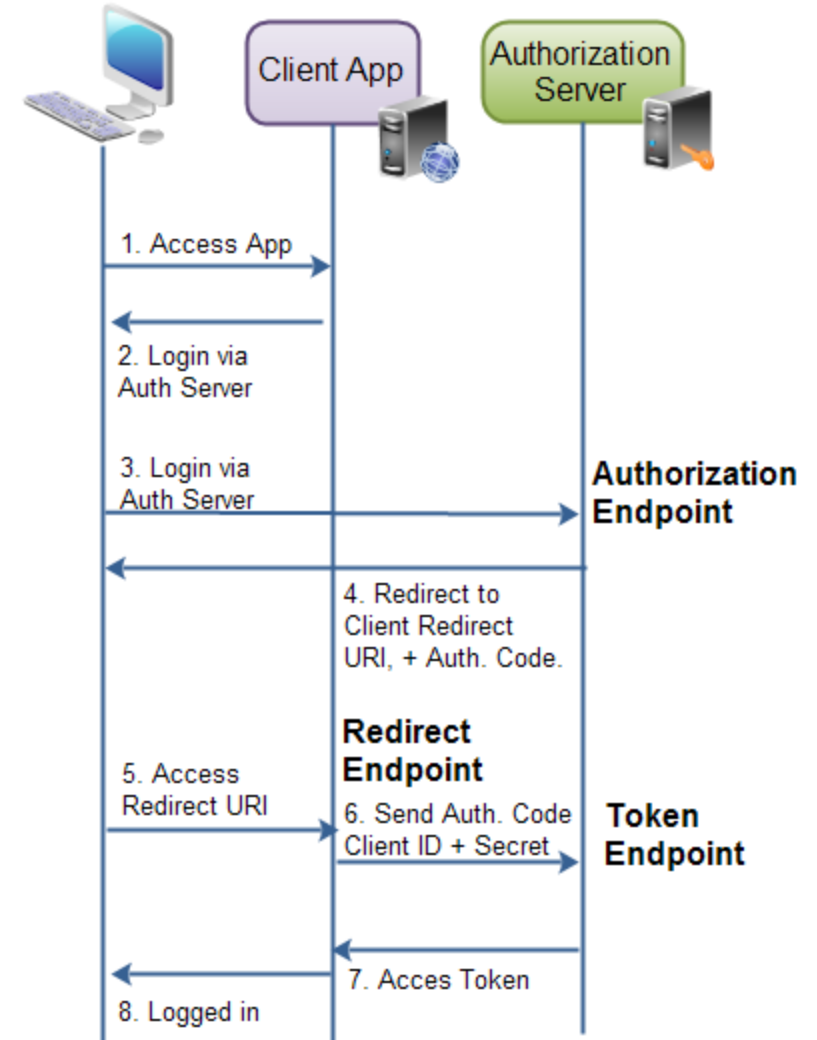

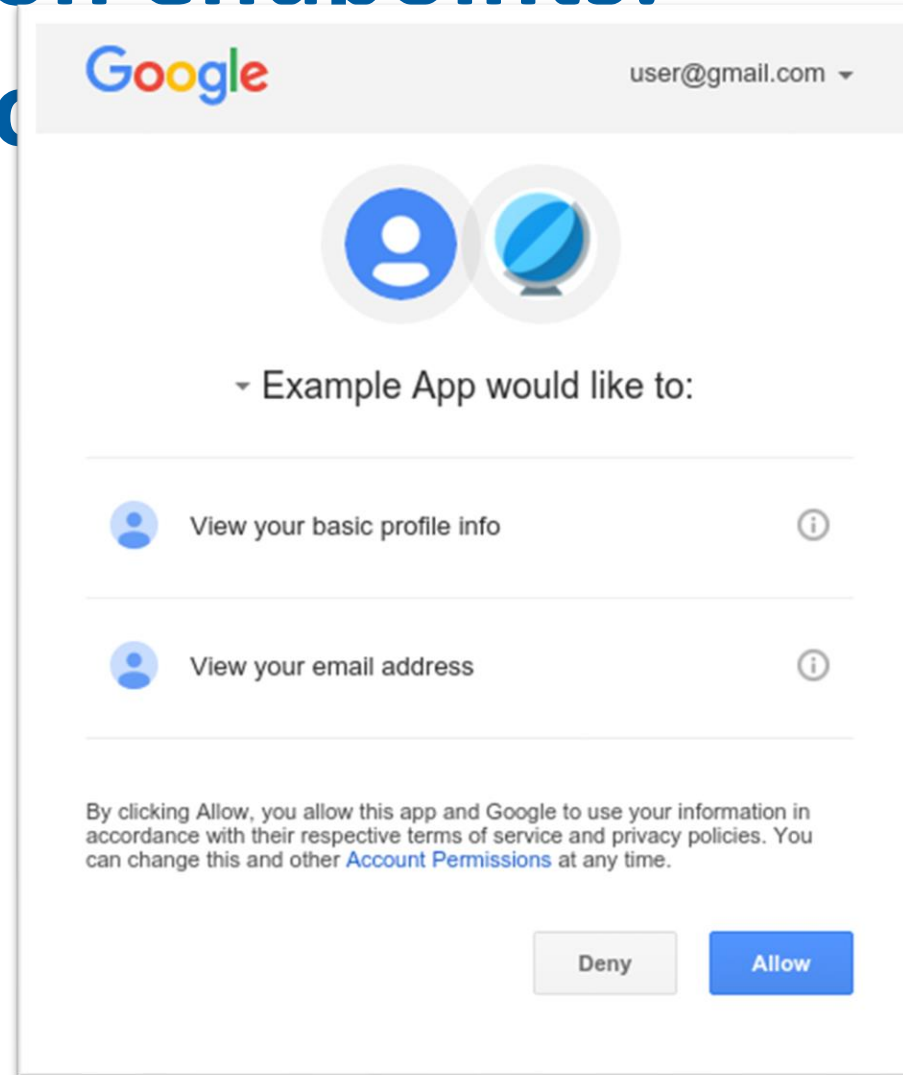

Image: <https://jenkov.com/tutorials/oauth2/endpoints.html>

Communication endpoints:

Authorization

Communication endpoints: Token endpoint

- ▶ Service provided by the **OAuth server**
 - ◆ Produces access tokens given an authorization grant
 - ◆ It can also produce refresh tokens
 - ◆ Refresh tokens can be used to get new tokens
 - With an authorization grant
- ▶ Client authentication
 - ◆ ClientID + ClientSecret + HTTP basic authentication

Image: <https://jenkov.com/tutorials/oauth2/endpoints.html>

Communication endpoints: Redirect endpoint

- ▷ Service provided by the client
 - ♦ It collects the authorization grant provided by the OAuth server
 - ♦ It should be called by the OAuth server using an HTTP redirect

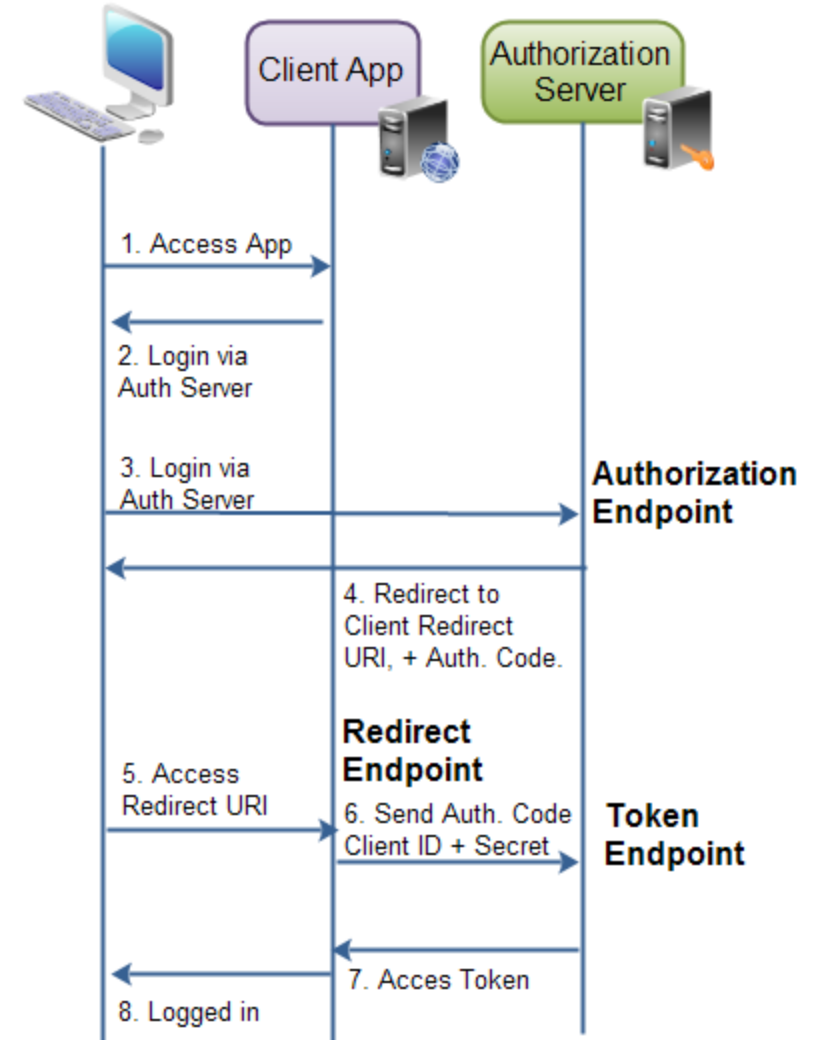

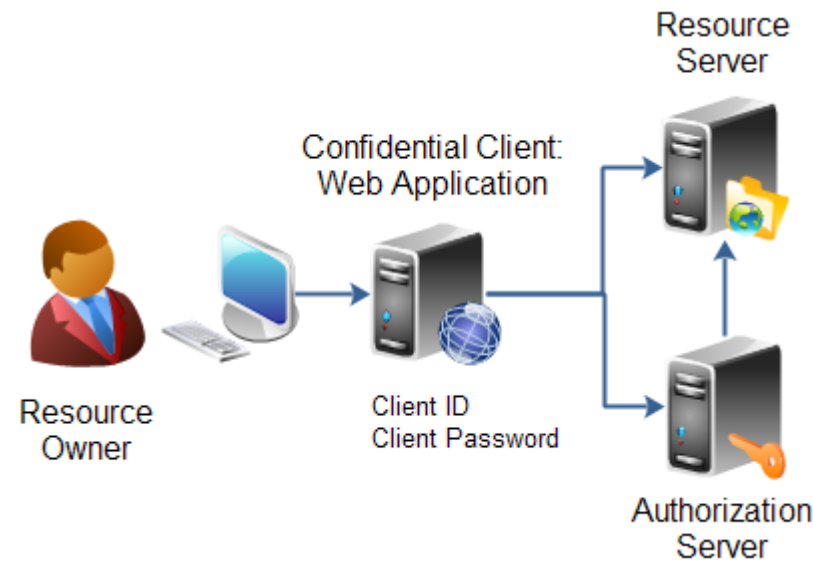

Image: <https://jenkov.com/tutorials/oauth2/endpoints.html>

Application (client) types

- ▷ Type is related with the ability to maintain the confidentiality of client credentials
 - ♦ Even from the resource owner
- ▷ Confidential
 - ♦ Capable
 - ♦ e.g. a secure server
- ▷ Public
 - ♦ Incapable
 - ♦ e.g. a web browser-based application, a mobile App
- ▷ Different application types will be allowed to execute different flows

Application (client) profiles

- ▶ Web application
 - ◆ Confidential client running on a web server

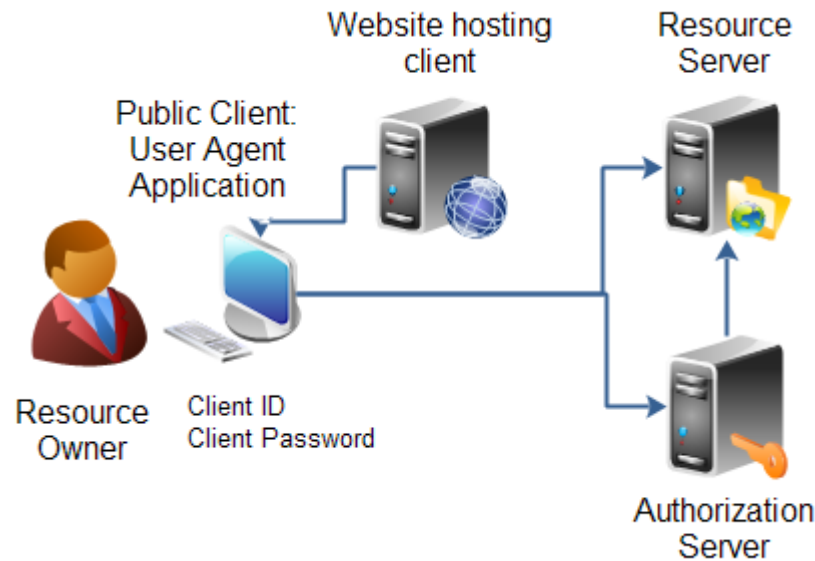

<https://jenkov.com/tutorials/oauth2/client-types.html>

Application (client) profiles

▷ User-agent based application

- ♦ Public client where the client code runs on a user-agent application
 - e.g. a browser

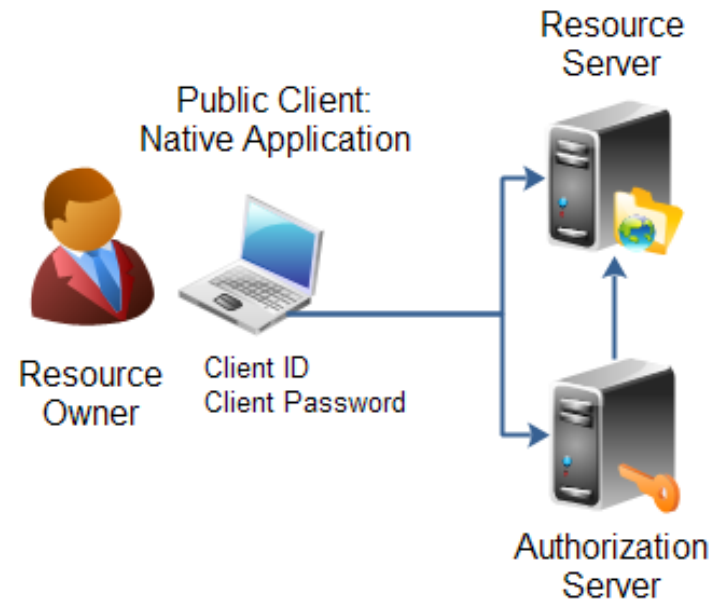

<https://jenkov.com/tutorials/oauth2/client-types.html>

Application (client) profiles

▷ Native application

- ♦ Public client installed and executed on the device used by the resource owner

<https://jenkov.com/tutorials/oauth2/client-types.html>

Application (client) registration (in an OAuth server)

- ▷ Clients accessing OAuth servers must be previously registered
 - ◆ Nevertheless, the standard does not exclude unregistered clients
 - ◆ A registered client is given a unique identifier
 - ClientID
- ▷ Registration includes both informational, legal and operational information
 - ◆ Redirection URLs
 - ◆ Acceptance of legal terms
 - ◆ Application (client) name, logo, web site, description
 - ◆ Client type
 - ◆ Client authentication method (for confidential clients)

OAuth tokens:

Authorization grant

- ▷ Created by an OAuth server
 - ♦ Upon authenticating a resource owner and getting its consent to grant access to a protected resource
 - ♦ An opaque byte blob that makes sense only to its issuer
- ▷ Short validity time
 - ♦ Just enough to get an access token

OAuth tokens:

Access token

- ▷ Created by an OAuth server
 - ♦ Upon authenticating a client and receiving an authorization grant
 - ♦ An opaque byte blob that makes sense to its issuer and to the resource owner
 - An access capability
- ▷ Bearer tokens
 - ♦ Clients need to protect their use with HTTPS
 - ♦ Clients can handover tokens to others

OAuth tokens:

Refresh token

- ▷ Created by an OAuth server
 - ♦ When creating an access token
 - ♦ An opaque byte blob that makes sense only to its issuer
 - ♦ It can be used to collect a new access token
 - Still requiring the client authentication

- ▷ Bearer tokens
 - ♦ Clients need to protect their use with HTTPS
 - ♦ Clients can handover tokens to others

OAuth flows

- ▶ Authorization code flow
 - ♦ 3-legged OAuth
 - ♦ Default OAuth flow
 - ♦ The most secure
- ▶ Implicit flow (grant)
- ▶ Resource owner password credentials flow
- ▶ Client credentials flow
 - ♦ 2-legged flow

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Authorization Code	✓	✓	✓	✓
Implicit Grant	✓	✗	✓	✗
Client Credentials	✗	✓	✗	✓
Password Grant	✓	✓	✓	✓

Authorization code flow

- ▷ 3-legged OAuth
 - ◆ Enables checking the identity of the 3 involved actors
- ▷ OAuth server authenticates the resource owner
 - ◆ Username + password or other means
- ▷ OAuth server authenticates the client
 - ◆ ClientID + ClientSecret + HTTP basic authorization
- ▷ Client authenticates the OAuth server
 - ◆ Certificate + URL

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Authorization Code	✓	✓	✓	✓

Authorization code flow

► Requirements

- ◆ Confidential application types
- ◆ Secure storage for tokens, ClientID and ClientSecret

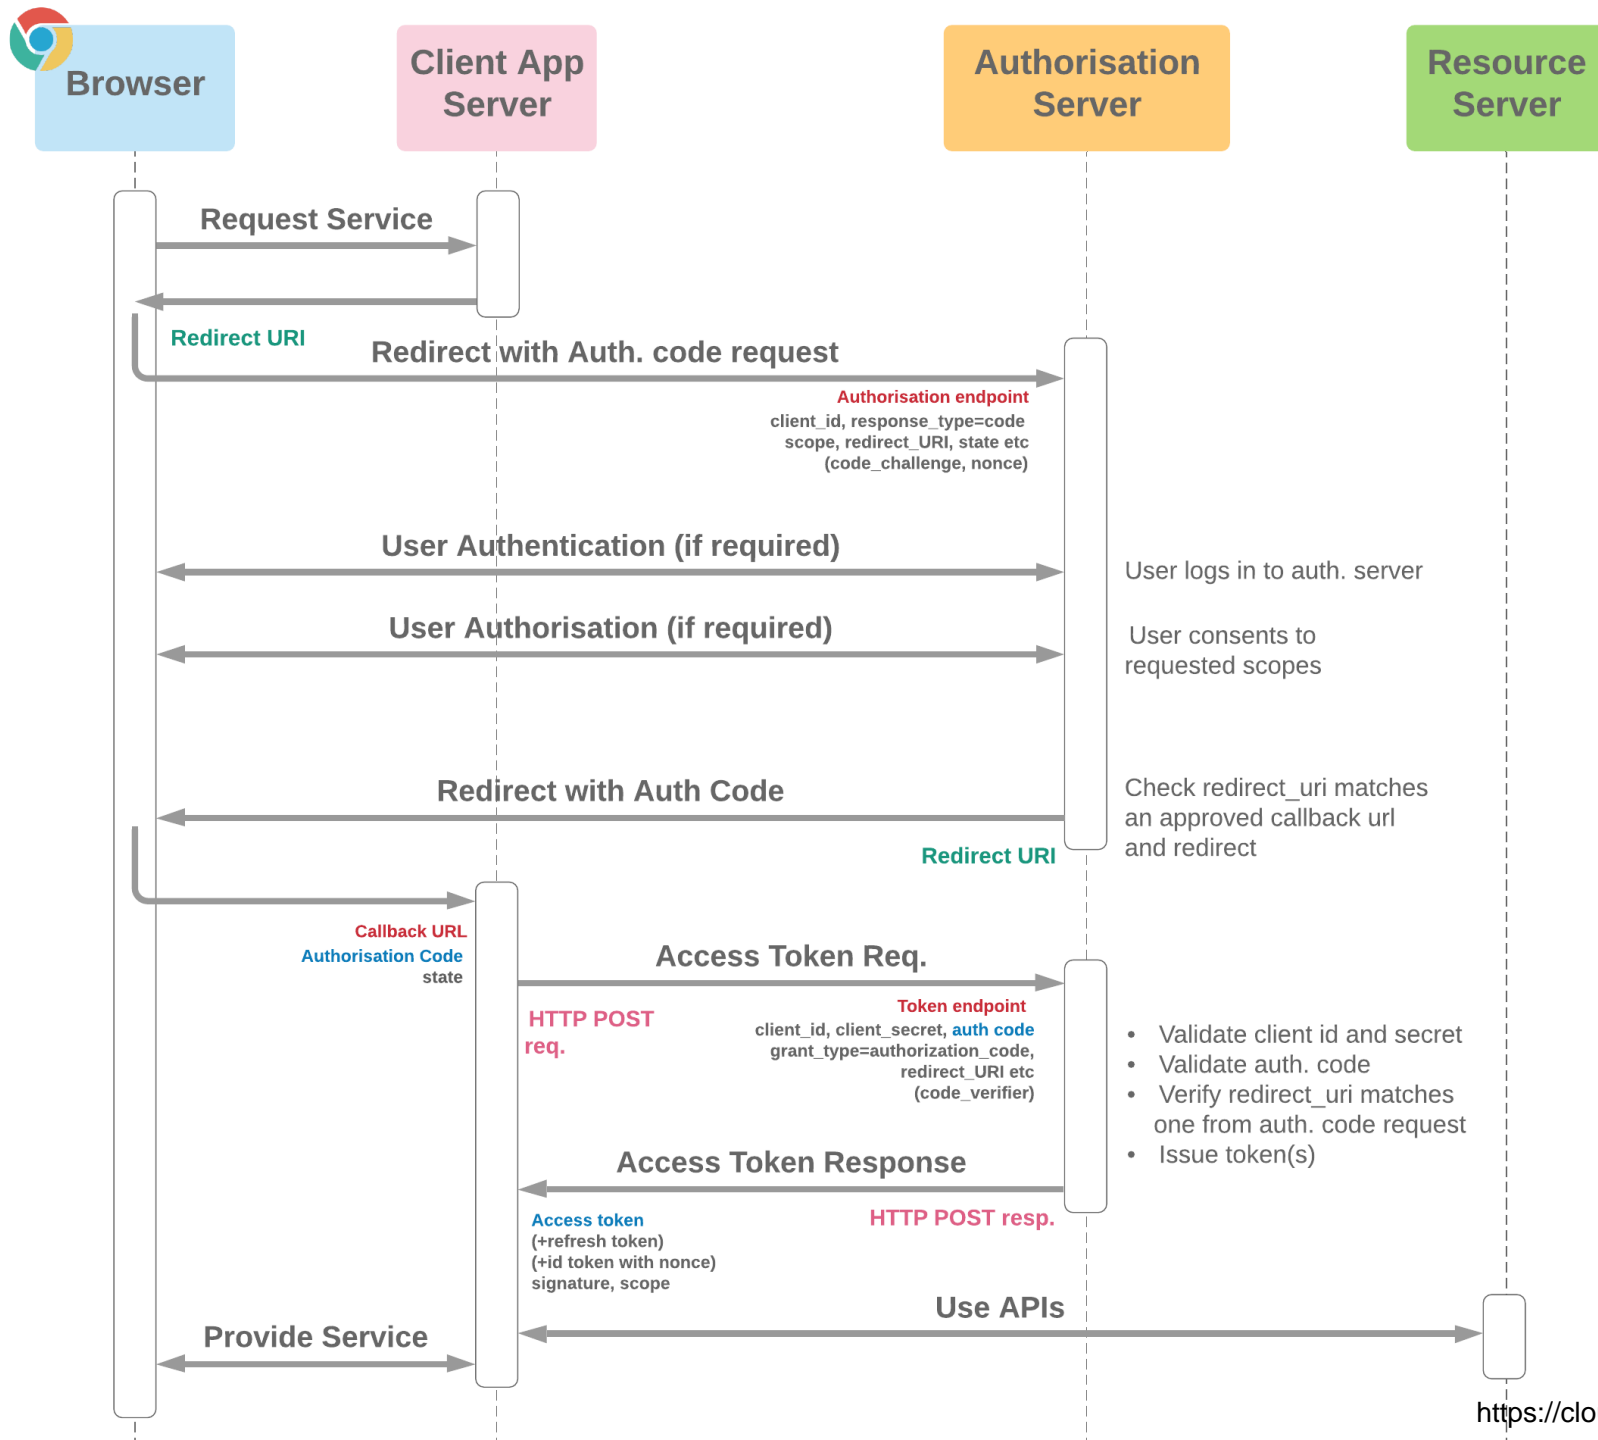

► Setup

- ◆ Client registration in the OAuth server
 - Client receives ClientID and ClientSecret
 - Not regulated by OAuth

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Authorization Code	✓	✓	✓	✓

Authorization code flow

- ▷ Resource owner uses a server-based Web App
 - ♦ The client
- ▷ The client uses the resource server API to get a resource
 - ♦ The resource server redirects the client to the OAuth server
- ▷ The OAuth server authenticates the resource owner
 - ♦ And sends an authorization grant to the client
- ▷ The client gets an access token from the OAuth server
 - ♦ Using its credentials (to have access permission)
 - ♦ Using its authorization grant
- ▷ The client uses again the resource server API to get a resource
 - ♦ This time providing an access token

Implicit flow

▷ Requirements

- ♦ Public application types

▷ Setup

- ♦ Client registration in the OAuth server
 - Client receives ClientID
 - Not regulated by OAuth

▷ Limitations

- ♦ No client authentication
- ♦ No refresh tokens

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Implicit Grant	✓	✗	✓	✗

Implicit flow

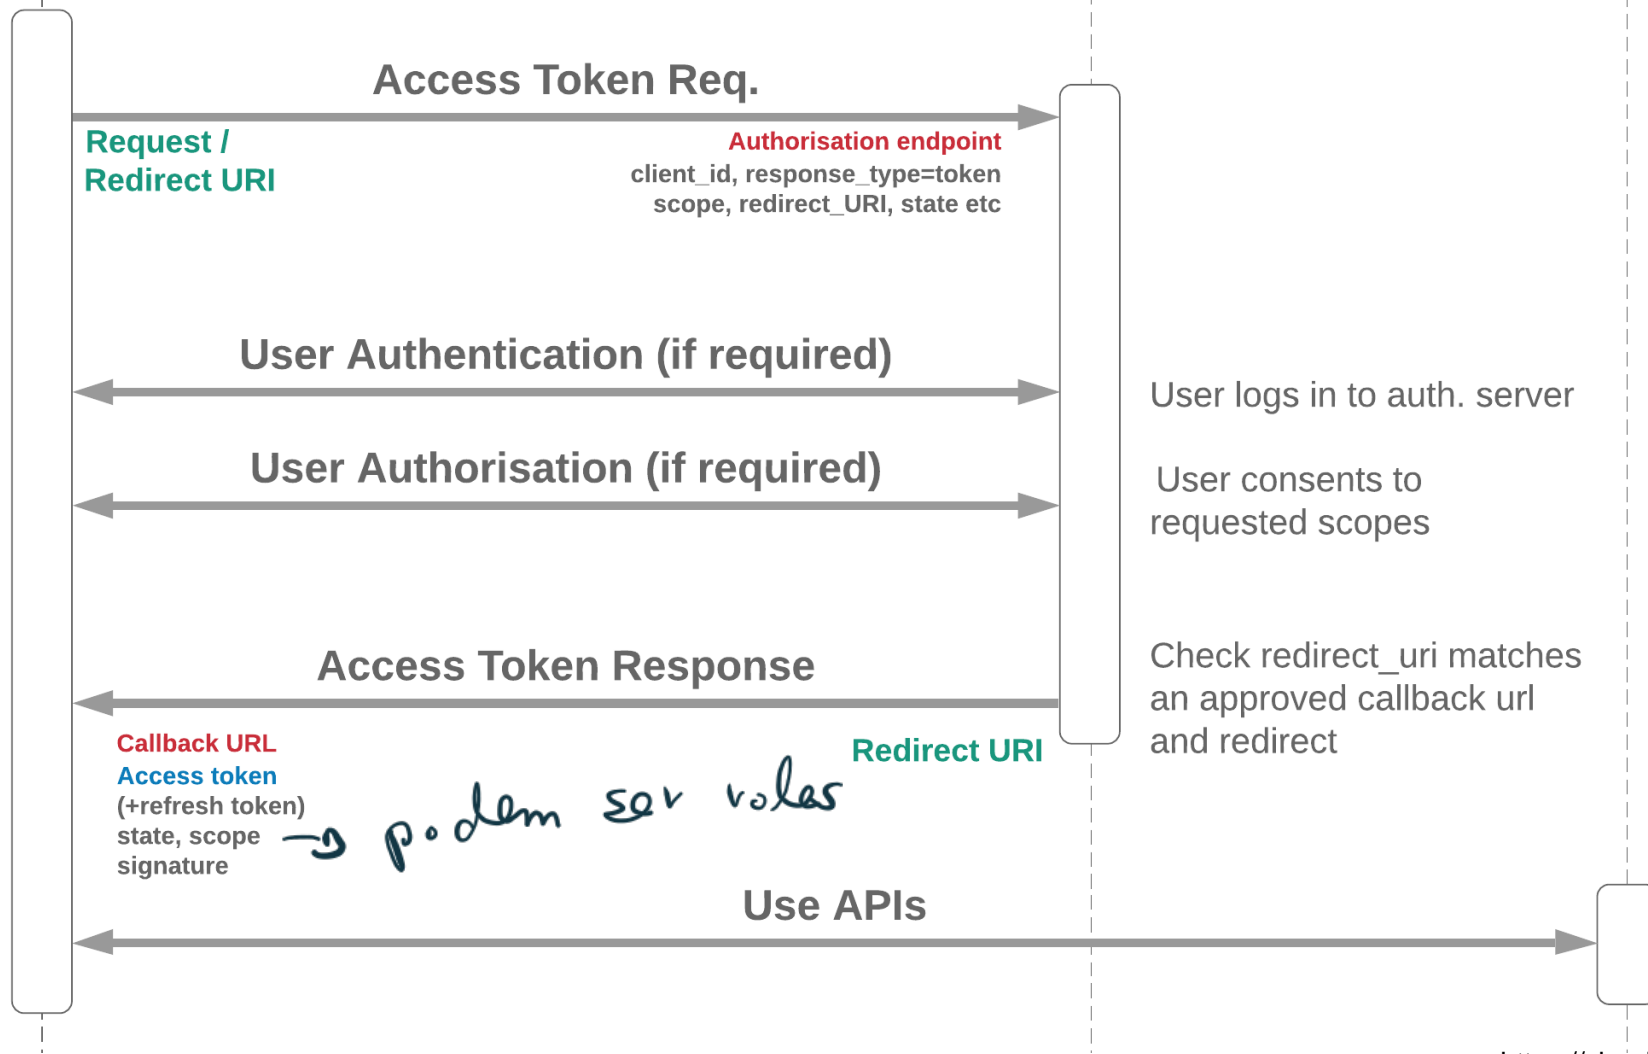

- ▷ Resource owner uses a mobile or client-based Web App
 - ♦ The client
- ▷ The client uses the resource server API to get a resource
 - ♦ The resource server redirects the client to the OAuth server
- ▷ The OAuth server authenticates the resource owner
 - ♦ And sends an access token to the client
- ▷ The client uses again the resource server API to get a resource
 - ♦ This time providing an access token

Browser

Authorisation
Server

Resource
Server

Resource owner password flow

▷ Requirements

- ◆ Confidential application types
- ◆ Sharing of resource owner credentials with client applications
- ◆ Secure storage for tokens, ClientID and ClientSecret

▷ Setup

- ◆ Client registration in the OAuth server
 - Client receives ClientID and ClientSecret
 - Not regulated by OAuth

▷ Limitations

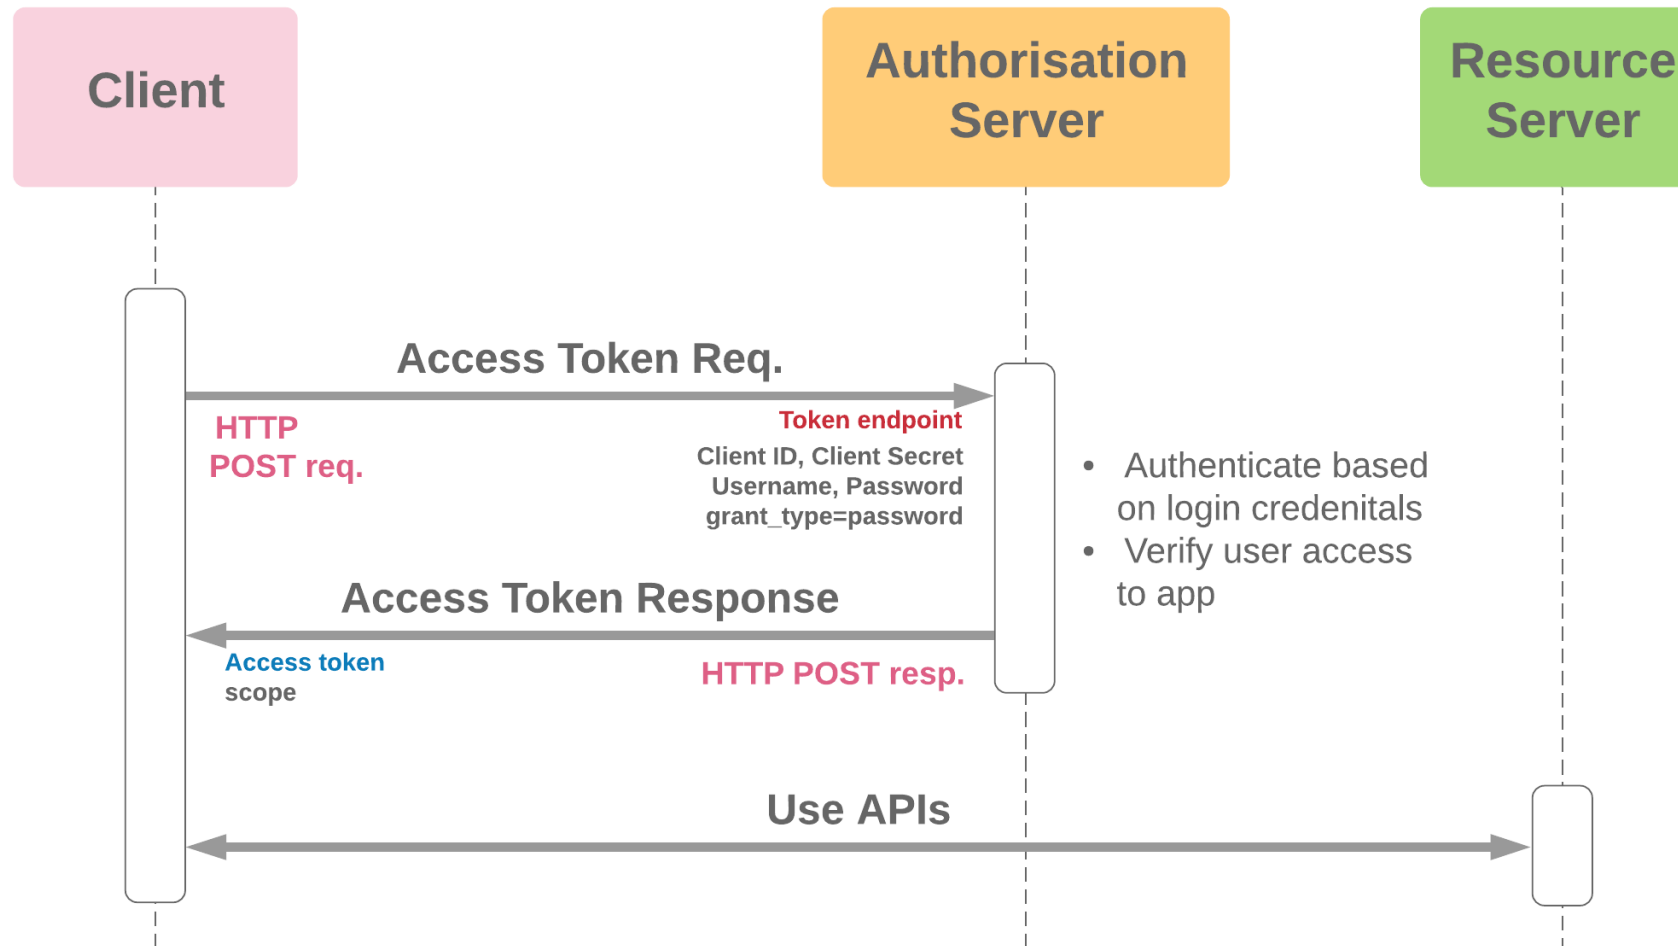

- ◆ Resource owners need to trust on client applications

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Password Grant	✓	✓	✓	✓

Resource owner password flow

- ▷ Resource owner uses a server-based Web App
 - ♦ The client
- ▷ The client uses the resource server API to get a resource
 - ♦ The resource server requests a token
- ▷ The client asks the resource owner for authentication credentials
- ▷ The client gets an access token from the OAuth server
 - ♦ Using its credentials (to have access permission)
 - ♦ Using the resource owner's credentials
 - ♦ These should be immediately discarded
- ▷ The client uses again the resource server API to get a resource
 - ♦ This time providing an access token

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Password Grant	✓	✓	✓	✓

Client credentials flow

▷ Requirements

- ◆ Confidential application types
- ◆ Secure storage for tokens, ClientID and ClientSecret

▷ Setup

- ◆ Client registration in the OAuth server
 - Client receives ClientID and ClientSecret
 - Not regulated by OAuth

▷ Limitations

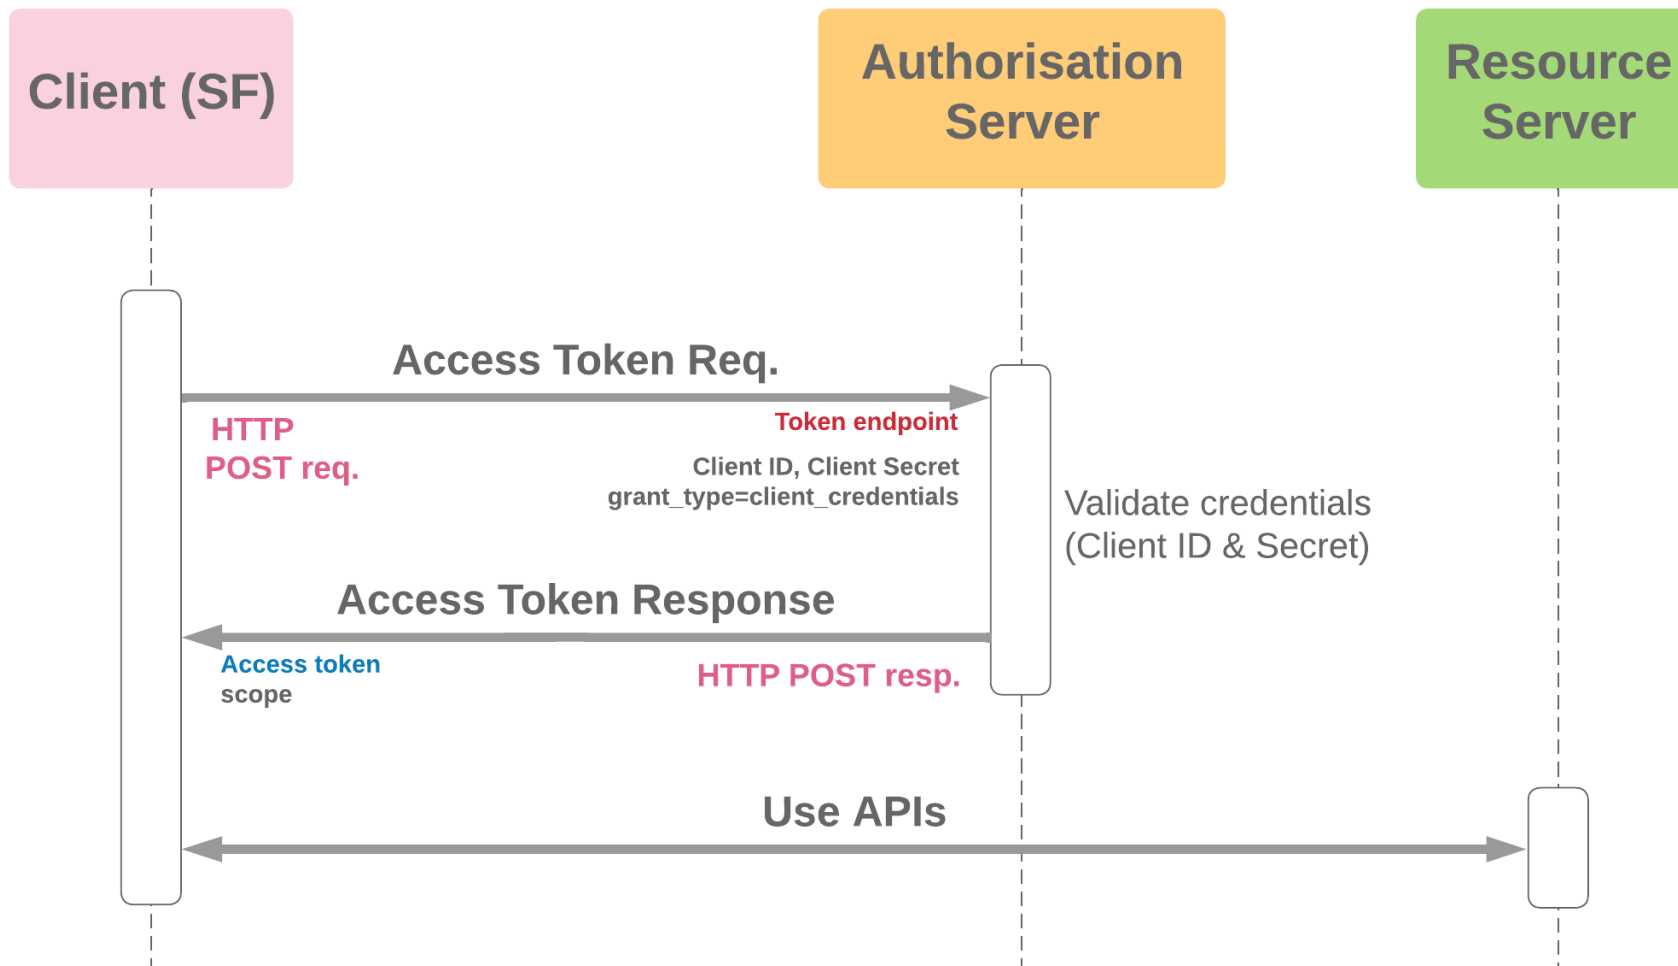

- ◆ No resource owner authentications or authorizations

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Client Credentials	✗	✓	✗	✓

Client credentials flow

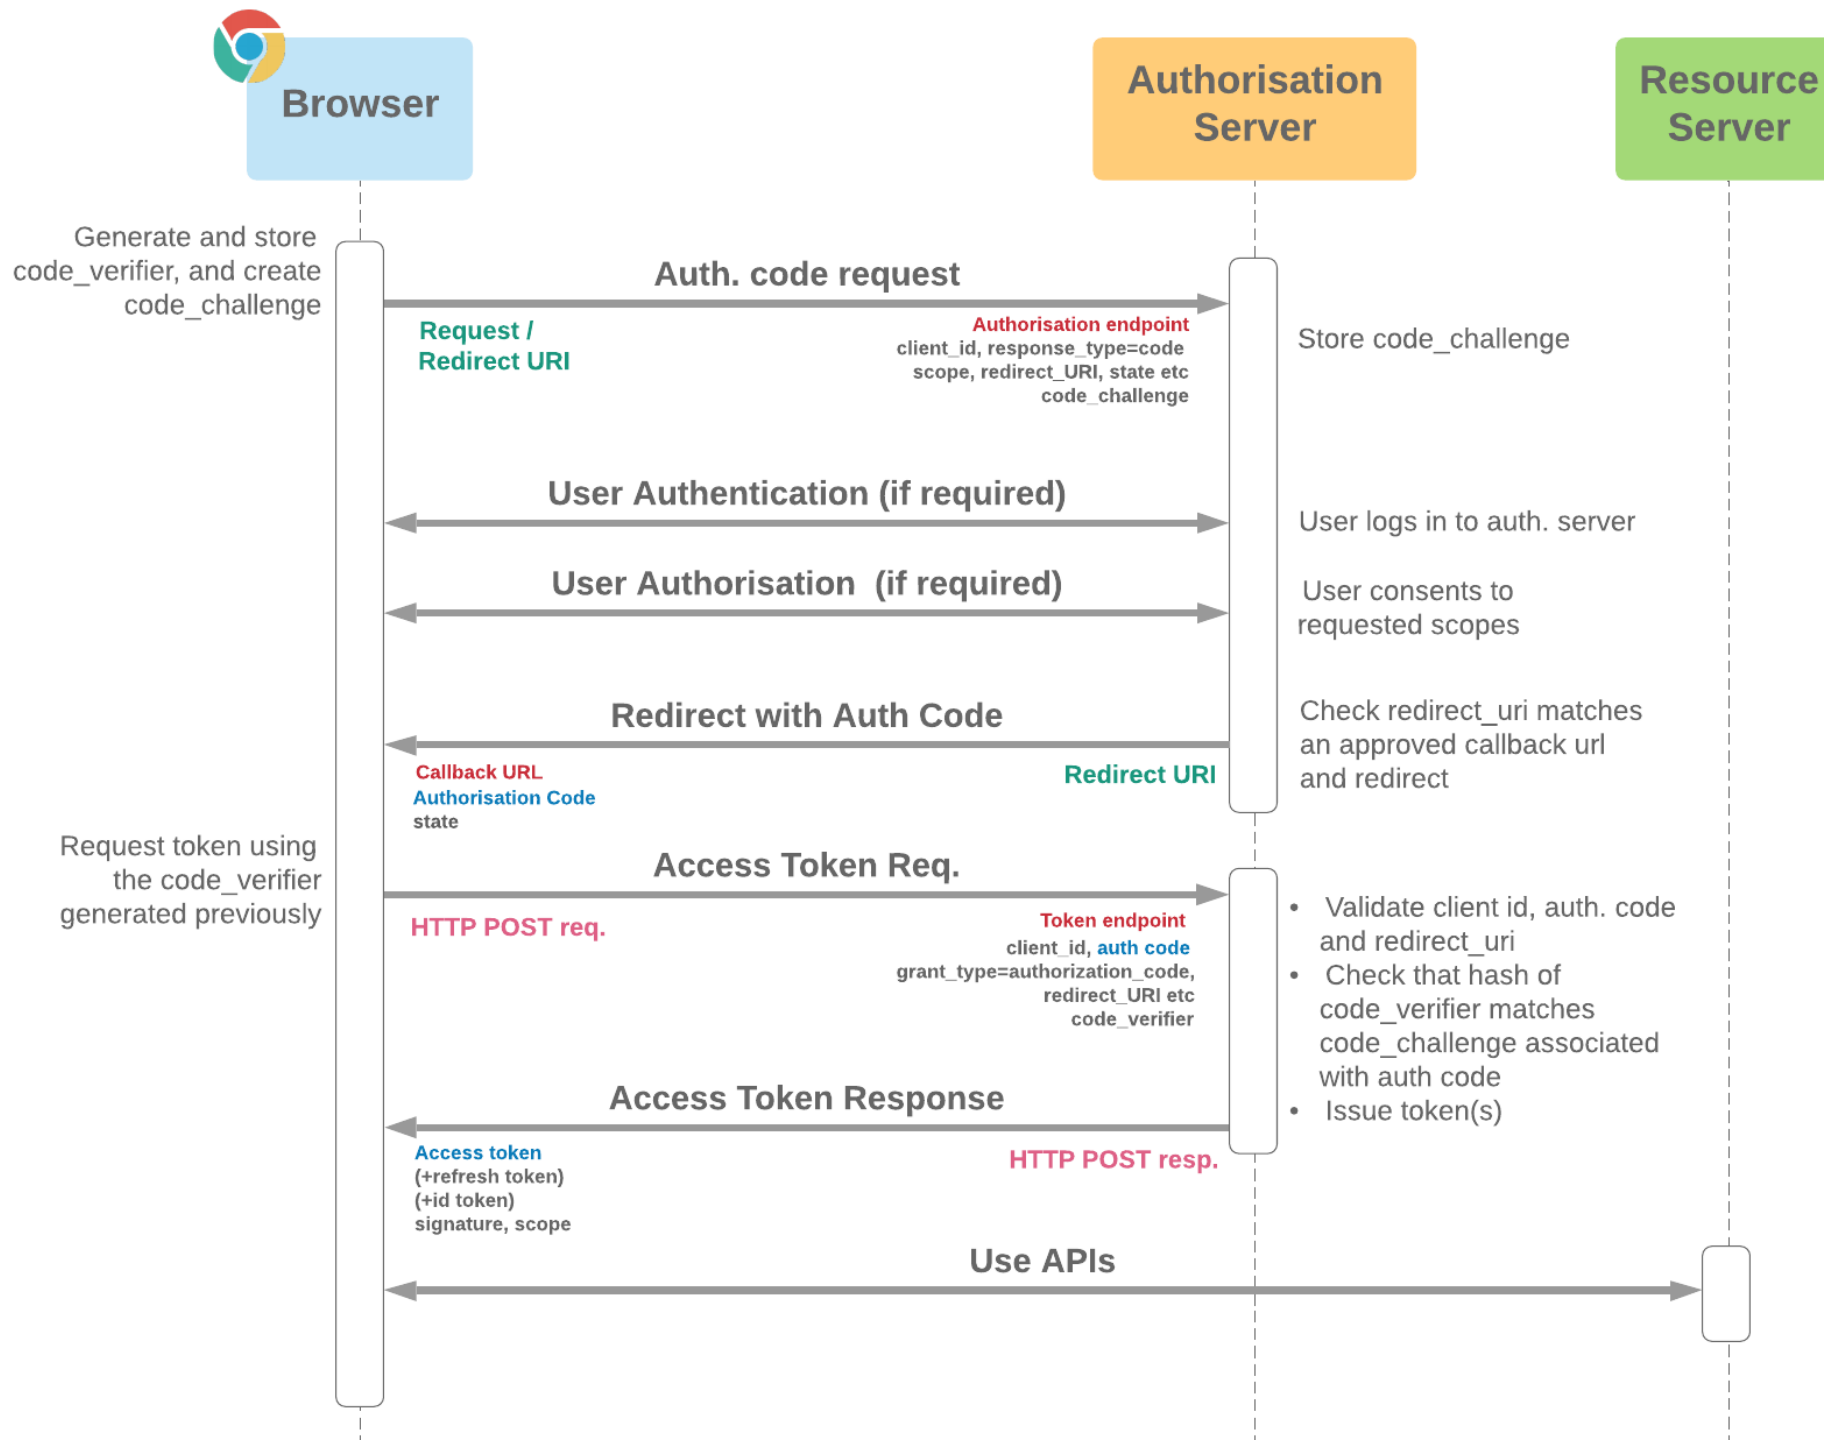

- ▶ Resource owner uses a server-based Web App
 - ♦ The client
- ▶ The client uses the resource server API to get a resource
 - ♦ The resource server requests a token
- ▶ The client gets an access token from the OAuth server
 - ♦ Using its credentials (to have access permission)
- ▶ The client uses again the resource server API to get a resource
 - ♦ This time providing an access token

OAuth 2 flows	Needs front end	Needs back end	Has user interaction	Needs client secret
Client Credentials	✗	✓	✗	✓

Proof Key for Code Exchange (PKCE, RFC 7636)

- ▷ Binds authorization grants to their requesters
 - ◆ Using a Code Challenge
 - A digest of a Code Verifier
 - A bit commitment
 - ◆ Cannot be used by eavesdroppers
- ▷ The requester is required to demonstrate the ownership of the authorization grant when fetching the access token
 - ◆ Providing the Code Verifier

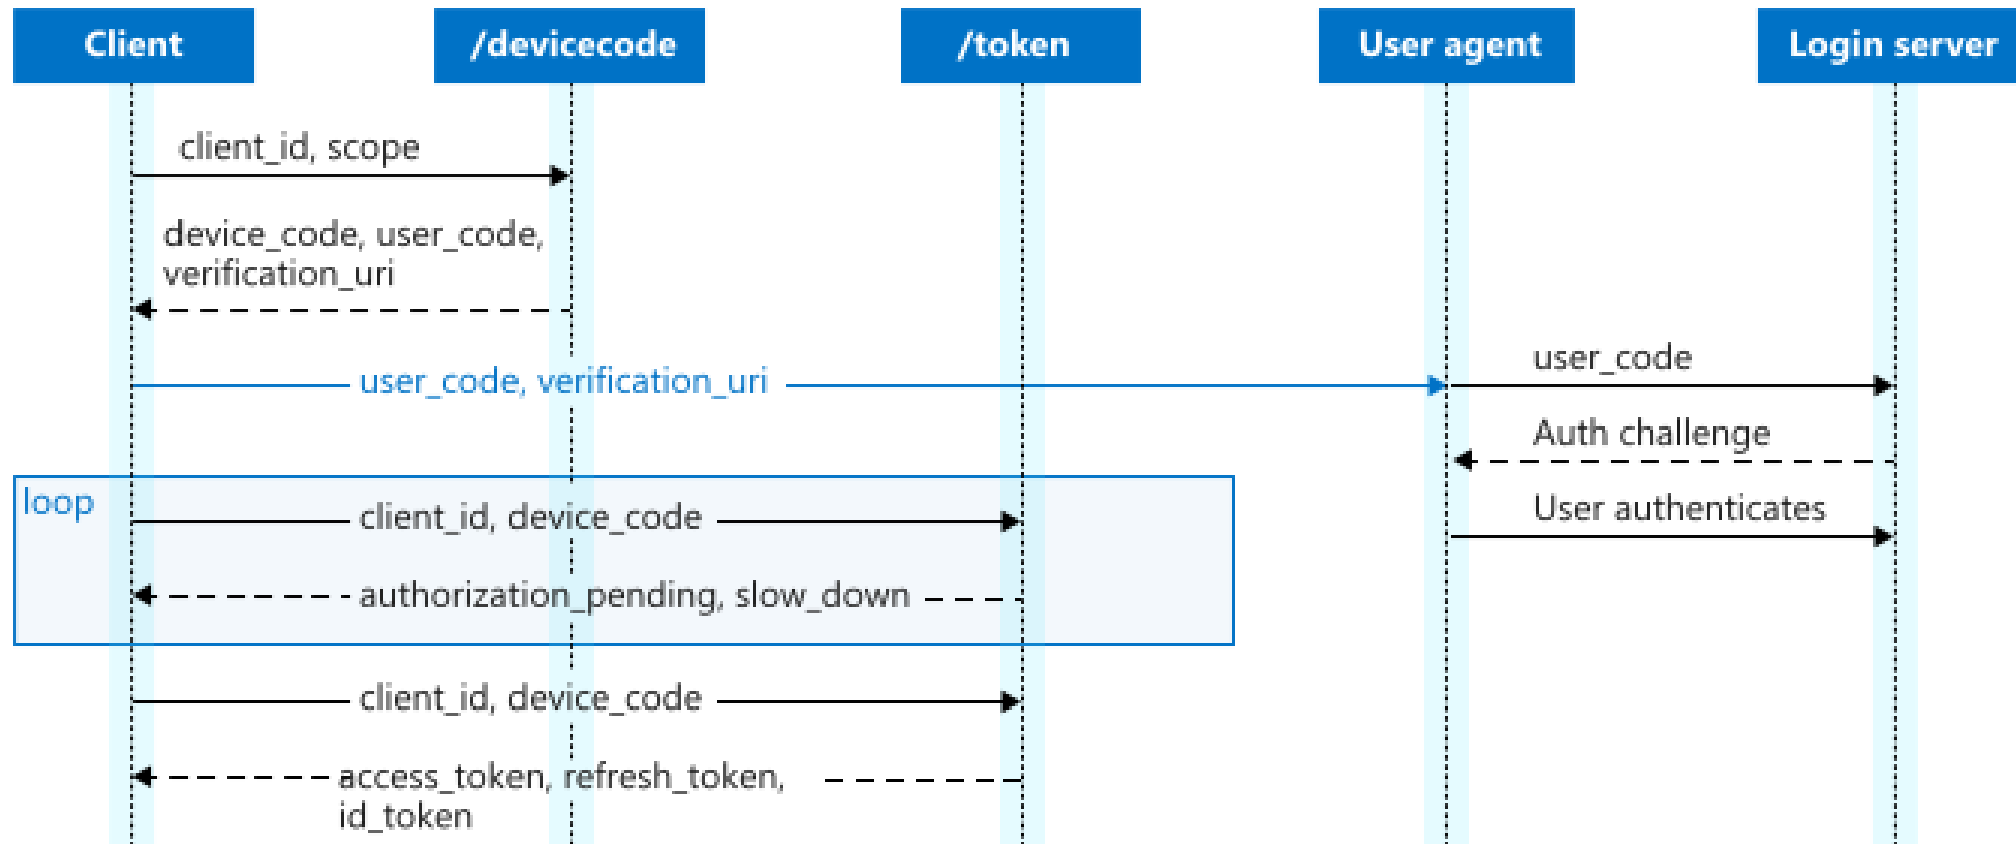

Device authorization grant (RFC 8628)

- ▷ In some cases the user is using a device with no browser to interact with a OAuth client
 - ◆ No HTTP redirections to Authorization server and back to client
 - ◆ No user interface
 - To authenticate the user
 - To review and authorize request

- ▷ Solution
 - ◆ Use a second device to perform the user authentication and to grant the authorization
 - e.g. mobile phone, tablet, etc.
 - ◆ Client fetches the access token from the Authorization server
 - Possibly with a refresh token

Device authorization grant (RFC 8628)

Actual protocol flow
